

Pre-Construction Anti Termite Treatment

1. We treat the sides and bottom surface of the foundation trenches and pits with chemical to a height of about 30cm at the rate of 5 Lit. per square meter of surface area.
2. Backfill earth on each side of all built up walls, which will be in immediate contact with the foundation, should be treated with chemical at the rate of 7.5Lit. per linear meter of vertical surface of the substructure, to a depth of 45cm and width of 15cm. The chemical shall be directed towards the masonry surfaces so that earth in contact with these surfaces is well treated with the chemical.
3. Before laying the floor, treat the top surface of the consolidated earth within the plinth walls with chemical at the rate of 5lit. per square meter. Ensure back fill against foundation is treated to its full depth. Builders should take care that any disruption of the barrier during later construction work (e.g. creation of gardens over the treated barrier), may lead to untreated gaps.

Post Construction Anti-Termite Treatment (For Existing Buildings) Treatment To Masonry Foundation (External Side)

- ◆ If there is loose soil around the walls of your building, we dig a shovel width trench close to the external wall of the building exposing the foundation wall surface upto a depth of 50cm.
- ◆ If there exists a concrete cover or masonry apron around the walls of your building, holes are drilled as close as possible to the plinth wall about 300mm (1ft) apart from each other. Insecticide is then poured, so that it reaches the soil to eliminate the termites present there and to stop them from re-infesting. If your building is on pillars, the holes are drilled around the pillars and insecticide poured into the soil.

Pest Control Service Reporting

- a) A detailed service report form will be filled by the team leader with regards to the service rendered mentioning the activity, time taken, chemicals used etc.
- b) The service report will be countersigned by a representative of the customer and a copy has to be maintained at the site where the service was delivered.

- ◆ Enhancing your living and working environment & reducing health risks.
- ◆ Protecting your property investments from pests.
- ◆ Providing the highest quality pest management services at a reasonable price, and to satisfy your expectations.

OUR SERVICES

Gel Treatment for Cockroaches

Gel Treatment is one of the most Environment Friendly Cockroach Control Methods. Gel baits are available with a variety of active ingredients, several of which can work on cockroaches. The cockroaches consume the bait and are killed by the active ingredient.

Ants & Bed Bugs Control (Chemical Insecticide sprayer)

Bed bugs are parasite insects that feed exclusively on blood. Chemical insecticide spraying technology is the most effective method and gives better result. All the crawling insects can be eradicated by this method.

Fumigation & Fogging

Fumigation is a method of pest control that completely fills an area with gaseous pesticides or fumigants to suffocate or poison the pests within. The chemical Compound is used in its gaseous state as a pesticide or disinfectant. Fogging is the same technology used in vast outdoor areas.

Rat and Rodent Control

Rodent control inside occupied building will be accomplished with trap devices. All such devices will be concealed out of general view and in protected areas so as not to be affected by routine cleaning and other operations. In circumstances when Rodenticide is deemed essential for adequate rodent control, Rodenticide will be used. Rodenticides shall be placed in locations that are inaccessible to children, pet, wildlife, and domestic animals. The lids of all bait boxes shall be securely locked or fastened shut.

Bird / Pigeon Control

Pigeon problems are common for many property owners all over the world. Pest pigeons & pigeon infestation can be a terrible nuisance as well as an expensive & harmful liability. We have the solution to get rid of them.

Anti Termite Control Treatment (Pre & Post Construction Termite Control)

Termite is a type of insect similar to an ant but are white in colour and they feed on "cellulose" which is found in abundance in the domestic wooden furniture, wood, carpets, rugs, curtains, fabrics, clothing, buildings so it is one of the dangerous insects. We assure, the permanent Eradication of the Termites and the company gives **WARRANTY for Decades**. We offer our Anti Termite Control Services for the existing constructions as well as the pre constructions.

Termite infestation is difficult to detect as they work from inside to outside. Termites need cellulose to survive and your belongings like wood (your furniture, boxes or even wooden flooring, doors and window frames) and paper are majorly at risk. Termites actually live hundreds of feet below the ground (right near the foundation of your house or building). Termites exist in huge colonies and not in small numbers. There would be huge colonies in thousands that you have to deal with. They spread their wings in no time eating into every corner of your home or office. If neglected you might just not have anything left in a few months time.

You definitely do not want to lose your important papers, expensive furniture and other belongings to these pests. Call our experts today.

Scope of our Anti Termite Treatment

The chemical barrier for your premise to have a termite free property - **WARRANTY for 20 Years!**

Pre-Construction Anti Termite Treatment

If you are planning to build a house or develop your property for building your office, termite control is the first thing you should think of. We use highly professional and advanced techniques for treating the termite infestation problem.

Direct liquid treatments are applied to the outside, inside and also in the foundation to eliminate the termites completely. Direct injection of liquid pesticide (termiticide) in areas like the foundation, within the foundation walls and also areas under the concrete slabs is part of our specialized termite control treatment plan.
